Physical Pragmatics (tsimane_0)

Preprocessing

Exclude participants from Pachual due to data quality concerns, as well as participants that answered 'unsure' since they are just noise.

```
# Read in the demographics and the participant data (excluding Pachual).
data_0 = read_csv(file.path(data_path, "raw_data.csv"))

# Decode the unique_id column.
data_1 = data_0 %>%
  separate(unique_id, into=c("date", "community", "participant"), "_")

# Exclude participants that answered 'unsure'.
exclusions = filter(data_1, response=="unsure")$participant
data_2 = data_1 %>%
  filter(!(participant %in% exclusions)) %>%
  select(participant, age, first_trial, door, object, response)

# Write the preprocessed participant data.
write_csv(data_2, file.path(data_path, "data.csv"))
```

Compute Door Endorsement

First, we'll analyze participant door endorsement (N=133, M=33.12 years, SD=15.4 years) for both door presentation conditions.

```
# Read in the preprocessed participant data.
data_2 = read_csv(file.path(data_path, "data.csv"))

# Set up the bootstrap functions.
compute_mean = function(data, indices) {
  return(mean(data[indices]))
}

compute_bootstrap = function(data, ft, d) {
  bool_data = data %>%
    filter(first_trial==ft, door==d) %>%
    mutate(response=ifelse(response=="leave", 1, 0))

  simulations = boot(data=bool_data$response,
                     statistic=compute_mean,
                     R=10000)

  return(boot.ci(simulations, type="perc")$perc)
}
```

```
# Compute the bootstrapped 95% CIs for the participant endorsement for leaving
# for both initial doors (i.e., both conditions).
set.seed(seed)
ci = data.frame()
bootstrap_data = compute_bootstrap(data_2, "no_cost", "no_cost")
ci = rbind(ci, data.frame(lower_ci=bootstrap_data[4],
                          upper_ci=bootstrap_data[5],
                          first_trial="no_cost",
                          door="no_cost"))

bootstrap_data = compute_bootstrap(data_2, "no_cost", "low_cost")
ci = rbind(ci, data.frame(lower_ci=bootstrap_data[4],
                          upper_ci=bootstrap_data[5],
                          first_trial="no_cost",
                          door="low_cost"))

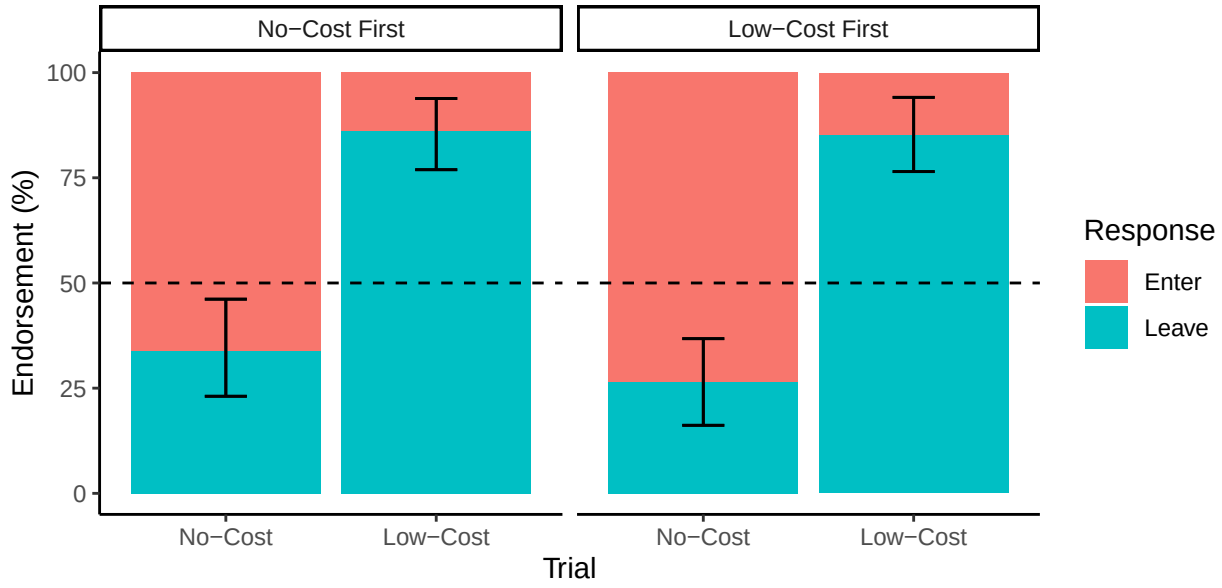
bootstrap_data = compute_bootstrap(data_2, "low_cost", "no_cost")
ci = rbind(ci, data.frame(lower_ci=bootstrap_data[4],
                          upper_ci=bootstrap_data[5],
                          first_trial="low_cost",
                          door="no_cost"))

bootstrap_data = compute_bootstrap(data_2, "low_cost", "low_cost")
ci = rbind(ci, data.frame(lower_ci=bootstrap_data[4],
                          upper_ci=bootstrap_data[5],
                          first_trial="low_cost",
                          door="low_cost"))

# Compute the participant endorsement for leaving for both first doors.
data_3 = data_2 %>%
  group_by(first_trial, door) %>%
  summarize(leave=sum(response=="leave")/n()*100, enter=100-leave) %>%
  gather(response, percentage, leave, enter) %>%
  left_join(ci) %>%
  mutate(lower_ci=lower_ci*100, upper_ci=upper_ci*100)

# Plot the data.
plot_0 = data_3 %>%
  ggplot(aes(x=door, y=percentage, fill=response)) +
  geom_histogram(stat="identity") +
  geom_errorbar(aes(ymin=lower_ci, ymax=upper_ci), width=0.2) +
  geom_hline(yintercept=50, linetype="dashed", color="black") +
  facet_wrap(~factor(first_trial,
                     levels=c("no_cost", "low_cost"),
                     labels=c("No-Cost First", "Low-Cost First"))) +
  theme_classic() +
  theme(aspect.ratio=1.0,
        legend.title=element_text(hjust=0.5)) +
  scale_x_discrete(name="Trial",
                   limits=c("no_cost", "low_cost"),
                   labels=c("No-Cost", "Low-Cost")) +
  ylab("Endorsement (%)") +
  scale_fill_discrete(name="Response",
```

```
                      limits=c("enter", "leave"),
                      labels=c("Enter", "Leave"))
plot_0
```



Now, we'll analyze the data after collapsing the door presentation conditions.

```
# Set up the bootstrap function.
compute_bootstrap = function(data, d) {
  bool_data = data %>%
    filter(door==d) %>%
    mutate(response=ifelse(response=="leave", 1, 0))

  simulations = boot(data=bool_data$response,
                     statistic=compute_mean,
                     R=10000)

  return(boot.ci(simulations, type="perc")$perc)
}

# Compute the bootstrapped 95% CIs for the participant endorsement for leaving.
set.seed(seed)
ci = data.frame()
bootstrap_data = compute_bootstrap(data_2, "no_cost")
ci = rbind(ci, data.frame(lower_ci=bootstrap_data[4],
                          upper_ci=bootstrap_data[5],
                          door="no_cost"))
```

```
bootstrap_data = compute_bootstrap(data_2, "low_cost")
ci = rbind(ci, data.frame(lower_ci=bootstrap_data[4],
                          upper_ci=bootstrap_data[5],
                          door="low_cost"))

# Collapse endorsement for leaving across conditions.
data_4 = data_2 %>%
  group_by(door) %>%
  summarize(leave=sum(response=="leave")/n()*100, enter=100-leave) %>%
  gather(response, percentage, leave, enter) %>%
  left_join(ci) %>%
  mutate(lower_ci=lower_ci*100, upper_ci=upper_ci*100)

# Plot the data.
plot_1 = data_4 %>%
  ggplot(aes(x=door, y=percentage, fill=response)) +
  geom_histogram(stat="identity") +
  geom_errorbar(aes(ymin=lower_ci, ymax=upper_ci), width=0.2) +
  geom_hline(yintercept=50, linetype="dashed", color="black") +
  theme_classic() +

```

Analyze Excluded Participants

Here we analyze the data from excluded participants to see if their judgments align with our main results.

```
# Extract the excluded participants and remove the trial where they responded
# with 'unsure'.
data_7 = data_1 %>%
  filter(participant %in% exclusions) %>%
  select(participant, age, first_trial, door, object, response) %>%
  filter(response!="unsure")

# Sum individual judgments by door type and response.
data_8 = data_7 %>%
  group_by(door, response) %>%
  summarize(count=n())

# Plot the data (using our labels of door difficulty).
plot_2 = data_8 %>%
  ggplot(aes(x=door, y=count, fill=response)) +
  geom_histogram(stat="identity", width=0.5, position="dodge") +
  theme_classic() +
  theme(aspect.ratio=1.0,
        legend.title=element_text(hjust=0.5)) +
  scale_x_discrete(name="Door",
                   limits=c("low_cost"),
                   labels=c("Low-Cost")) +
  scale_y_discrete(name="Endorsement (Count)",
                   limits=c(0, 2, 4, 6, 8, 10)) +
  scale_fill_discrete(name="Response",
                      limits=c("enter", "leave"),
                      labels=c("Enter", "Leave"))
